Digital forms that write back to SAP.

FastForms is a form builder and mobile app for SAP maintenance teams. Admins design forms with drag-and-drop ease, bind fields to SAP data, and set rules that route the right form to the right technician. Technicians fill them out on mobile, and every submission flows back to SAP.

With FastForms.

- ✓ Technicians have the right form at the right time.
- ✓ Submissions flow straight to SAP.
- ✓ Forms pre-fill with SAP context.
- ✓ Every submission is tracked and exportable.
- ✓ Admins build and update forms without code.

Without FastForms.

- ✗ Technicians waste time hunting for paper forms.
- ✗ Data stays on paper or never reaches SAP.
- ✗ Information is filled in by hand, often incomplete.
- ✗ No audit trail until someone scans a binder.
- ✗ Updates require reprinting and redistribution.

What it gives your team.

Drag-and-drop form builder: Build multi-section forms visually in a browser. Text, numbers, dates, signatures, photos, and more. No code required.

SAP-bound fields: Connect fields to work orders, assets, and functional locations. Forms pre-fill from SAP context.

Rules-based distribution: Define who gets which form and when. Rules evaluate against order type, plant, work center, and equipment at runtime.

Offline mobile forms: Technicians fill out forms on iOS and Android without a signal. Data syncs to SAP when connectivity returns.

Version control: Every form template is versioned. Roll back or publish updates with confidence.

Submission tracking and PDF export: Track every submission in real time and generate PDFs for compliance documentation.
